

Keeping your network safe and sound

With the latest firewall technology

Your network's security is crucial to the smooth running of your business. After all, you don't want to waste time and money dealing with computer Viruses, Worms or Trojans.

This is why at Intraspace we use only the best available firewall technology – SonicWALL, with Gateway Anti-Virus (GAV) and Intrusion Prevention System (IPS).

How can a SonicWALL firewall protect you?

Your network security is only as good as the firewall protecting it. SonicWALL firewalls comply with numerous regulations and standards and offer high-performance, affordable and best-in-class network protection that:

- Prevent direct access to non-public parts of your network, like files, CCTV and printers.
- Prevent any harmful inbound or outbound traffic that matches recognised malicious patterns.
- Stop Viruses, Worms and Trojans from entering or leaving your network. These incidents are reported immediately to allow any infected machines to be cleaned quickly – preventing any further spread – and keeping costs down.
