

Make remote access a reality

With a Remote User VPN

Remote working brings many valuable benefits to your business: Flexibility, staff retention and satisfaction, cost reduction, being prepared for disasters and increasing your green credentials.

A Remote User Virtual Private Network (VPN) is one of the best ways to realise these benefits – by allowing a specific remote computer secure access to whatever your firewall is protecting. So whether you have a single office or a group of offices connected using Site-to-Site VPN or a Private Wide Area Network, and you want to make remote working a reality, a Remote User VPN is the answer.

As experts in Internet technologies, Intraspace are ideally positioned to help you implement this solution.

Remote User VPN

- Allows employees to safely connect to the office remotely
- Employees can work from home just as if they were in the office
- Allows users to access any of your other sites – compatible with Site-to-Site VPN and PWAN networks

We strongly recommend using our Firewall Management and a SonicWALL firewall along with a VPN. This bolsters security and increases employee productivity by blocking access to inappropriate sites.

We can also use a Virtual Private Network to connect entire offices. If you would like more information about linking your sites, just speak to one of our team.

Want to find out more about VPN solutions? We're here to help.

To find out more about implementing a Virtual Private Network, or a SonicWALL firewall, call us on 0845 3886893. Our team will help you find the solution to fit your requirements.
